1 Slide Transition

Advanced PDF readers support slide transitions. The following are the commands for different transition styles, 1. `\transblindshorizontal` 2. `\transblindsvertical` 3. `\transboxin` 4. `\transboxout` 5. `\transcover` 6. `\transdissolve` 7. `\transfade` 8. `\transfly` 9. `\transglitter` 10. `\transpush` 11. `\transreplace` 12. `\transsplitverticalin` 13. `\transsplitverticalout` 14. `\transsplithorizontalin` 15. `\transsplithorizontalout` 16. `\transwipe`

And `\transduration` command is used inside frame environment to specify the number of seconds for the transition of particular slides generated by the frame. For example, `\transduration<2>{3}` sets 3 seconds transition time for the second slide.

2 Controlling Slides

2.1 Zero Slides

You can create frames with zero slides. For example, `\begin{frame}<0> ... \end{frame}` is a frame with no slides for presentation. This is useful when you are using the same \LaTeX code for multiple purposes — report, presentation, poster.
