1 Mathematics

LATEX has a special mode for mathematics called **math mode**. LATEX changes into or returns from math mode on each occurance of dollar, \$ symbols.

Let x be an integer.\\
Let x be an integer.
Let x be an integer.
Let x be an integer.

Figure 1: math mode

In figure 1 at line 1, LaTeX prints Let, enters into math mode, prints x, exits from math mode and prints be an integer. But at line 2, LaTeX prints everything in text mode. You might think that the difference in output isn't much. But, it is better to write variable names and numbers in math mode for readability of the document. And math mode supports complicated mathematical expressions as well.

1.0.1 Superscript and Subscript

In math mode, characters caret ^and underscore _ are used for writing superscripts and subscripts respectively. Exponents are also written using superscripts. For example, a^2+b_3 is written as \$ a^2 + b _ 3 \$.

Warning : When the superscript/subscript is not a single character/digit, then LATEX blocks should be used. For example, 2^{10} and 2^{10} respectively.

Writing multilevel superscript/subscript without using blocks will throw an error as IATEX can't predict the priority. When you are using multilevel superscript/subscript, then the superscript/subscript at next level should be in written in a subblock. For example, $a_{cd} = a_{cd}$ and $a_{cd} = a_{cd}$ respectively. Clearly, the first looks better than the second.

2 Operators

Most of the symbols like +, -, = are readily available in math mode. LATEX allows you to write complicated symbols and expressions using commands. The following are a few commonly used symbols,

Symbol	Command	Symbol	Command	Symbol	Command
\in	\in	∉	\notin	<i>≠</i>	\ne
\rightarrow	\to	<u> </u>	\geq	<u> </u>	\leq
C	\subset	×	\times	3	\exists
A	\forall	Λ	\cap	U	\cup

Table 1: Basic Symbols

2.1 Basic Expressions

When you are writing, your content might need some mathematical symbols occasionally. You will have to use dollars \$ for each occurance. But, for writing mathematical expressions you don't have to add dollars \$ for each symbol. You can enter into math mode, write mathematical content and then return to text mode.

Figure 2: Basic Expressions

At first, you might find it hard to remember these commands. But, aftering practise IATEX for a month, you will realise that you have to remember only a handful of commands.

3 Greek Letters

In mathematics, we often use greek alphabets. LATEX math mode has commands for each greek alphabet. For example, α .

You might be wondering how to print $\Gamma, \Delta, \Phi, \cdots$. The uppercase variants of greek alphabets are also available. And it is not hard to remember the commands.

4 Other Symbols

Other than greek letters are there are many symbols used in mathematics for different operators which includes ∇ and \wp .

Alphabet	Command	Alphabet	Command	Alphabet	Command
α	\alpha	β	\beta	γ	\gamma
δ	\delta	ϵ	\epsilon	ζ	\zeta
η	\eta	θ	\theta	ι	\iota
κ	\kappa	λ	\lambda	μ	\mu
ν	\nu	ξ	\xi	Ø	\o
π	\pi	ρ	\rho	σ	\sigma
au	\tau	v	\upsilon	ϕ	\phi
χ	\chi	ψ	\psi	ω	\omega

Table 2: Greek Alphabets

Alphabet	Command	Alphabet	Command	Alphabet	Command
Γ	\Gamma	Δ	\Delta	Θ	\Theta
Λ	\Lambda	Σ	\Sigma	Ψ	\Psi
Ξ	\Xi	П	\Pi	Υ	\Upsilon
Ø	\O	Φ	\Phi	Ω	\Omega

Table 3: Greek Alphabets in Uppercase

5 Bringing it all together

The mathematical contents will look a bit different from text. However, the document remains beautiful. In LATEX documents the mathematical contents flows along with the text. This is not by accident. LATEX uses advanced algorithms to generate beautiful document.

Figure 3: Writing mathematics

Symbol	Command	Symbol	Command	Symbol	Command
\oplus	\oplus	∂	\partial	∇	\nabla
V	\vee	^	\wedge	*	\ast
\Re	\Re	3	\Im	×	\aleph
∞	\infty		\cdot	0	\circ
٠	\ddots		\cdots	:	\vdots
Ø	\wp	\int	\int	*	\star

Table 4: Other Symbols
